Overview

- Introduction
- 2 Program graphs
- Algorithm overview
- 4 Example execution
- Conclusion

Terms

Safety verification

Prove that an assertion is always true at a location

Terms

Safety verification

Prove that an assertion is always true at a location

Non-compositional safety verification

Safety verification where the whole program is analyzed in one step

Terms

Safety verification

Prove that an assertion is always true at a location

Non-compositional safety verification

Safety verification where the whole program is analyzed in one step

Compositional safety verification

Safety verification where program parts are analyzed semi-independently and composed

Motivation

Scalability ← Loss in precision

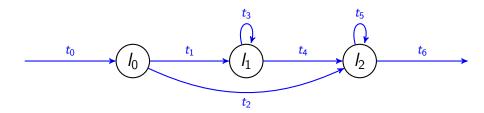

$$\mathcal{L} = \{\ell_0, \ell_1, \ell_2\}$$

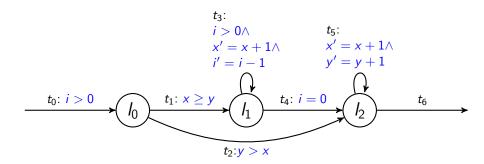

$$I_2$$

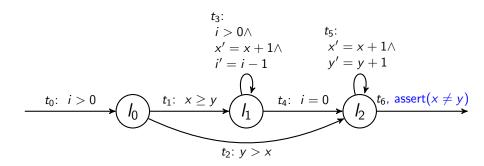

$$\mathcal{L} = \{\ell_0, \ell_1, \ell_2\}$$
 , $\mathcal{T} = \{t_i \mid i \in \{1, \dots, 6\}\}$

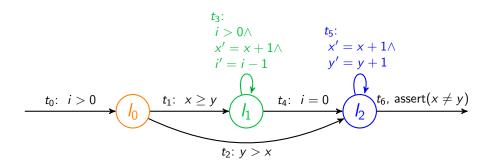

$$\mathcal{L}=\{\ell_0,\ell_1,\ell_2\}$$
 , $\mathcal{T}=\{t_i\mid i\in\{1,\dots,6\}\}$, $\mathcal{V}=\{x,y,i\},~\mathcal{V}'=\{x',y',i'\}$

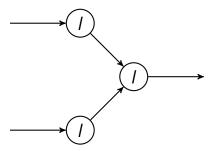

$$\mathcal{L}=\{\ell_0,\ell_1,\ell_2\}$$
 , $\mathcal{T}=\{t_i\mid i\in\{1,\dots,6\}\}$, $\mathcal{V}=\{x,y,i\},~\mathcal{V}'=\{x',y',i'\}$

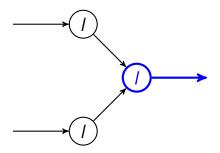

$$\mathcal{L}=\{\ell_0,\ell_1,\ell_2\}$$
 , $\mathcal{T}=\{t_i\mid i\in\{1,\dots,6\}\}$, $\mathcal{V}=\{x,y,i\},~\mathcal{V}'=\{x',y',i'\}$

Example program

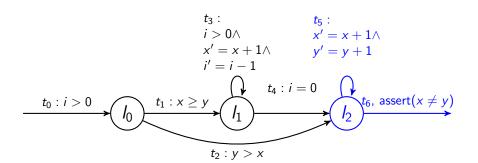

Task

Prove that the program is safe for $x \neq y$ at t_6

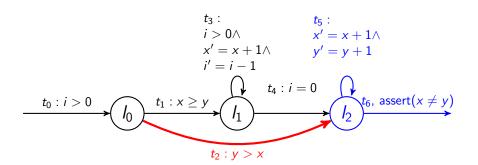

CheckSafe on $\{\ell_2\}$ for $x \neq y$

 t_6 does not already imply $x \neq y$ t_6 is not an initial transition Call CondSafe

$$I_{\ell_2,1}(\{x,y,i\}) \equiv i_{\ell_2,1} + i_{\ell_2,1,x} * \mathbf{x} + i_{\ell_2,1,y} * \mathbf{y} + i_{\ell_2,1,i} * \mathbf{i} \leq 0$$

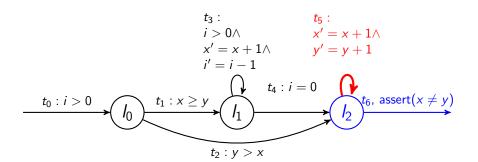

$$\mathbb{I}_{t_2,1,1} \equiv y > x \wedge i' = i \wedge x' = x \wedge y' = y \Rightarrow I'_{\ell_2,1,1}$$

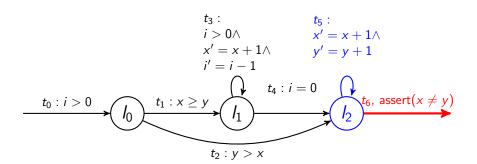

$$\mathbb{I}_{t_4,1,1} \equiv i = 0 \wedge i' = i \wedge x' = x \wedge y' = y \Rightarrow I'_{\ell_2,1,1}$$

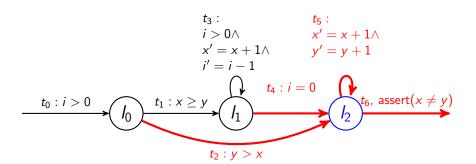

$$\mathbb{C}_{t_5,1} \equiv \mathit{I}_{\ell_2,1} \land \, x' = x + 1 \land y' = y + 1 \land \mathit{i}' = \mathit{i} \, \Rightarrow \mathit{I}'_{\ell_2,1}$$

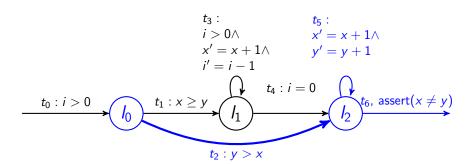

$$\mathbb{S}_1 \equiv \textit{I}_{\ell_2,1} \land \textit{i'} = \textit{i} \land \textit{x'} = \textit{x} \land \textit{y'} = \textit{y} \Rightarrow \textit{x'} \neq \textit{y'}$$

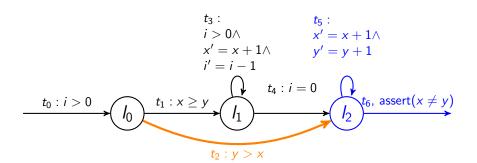

Max-SMT on $\{\ell_2\}$ for $x \neq y$

$$\begin{split} \mathbb{F}_1 &\equiv \mathbb{C}_{t_5,1} \wedge \mathbb{S}_1 \wedge (\mathbb{I}_{t_2,1,1} \vee \neg \rho_{t_2}) \wedge (\mathbb{I}_{t_4,1,1} \vee \neg \rho_{t_4}) \wedge [\rho_{t_2},1] \wedge [\rho_{t_4},1] \\ \text{Assume } x > y \text{ does satisfy } \mathbb{F}_1 \end{split}$$

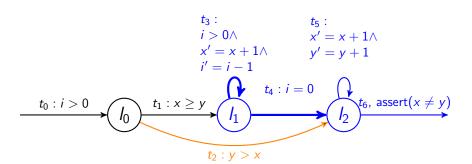

CheckSafe on $\{\ell_0\}$ for x > y

 t_2 does not already imply x > y t_2 is not an initial transition Call CondSafe

CheckSafe on $\{\ell_0\}$ for x > y

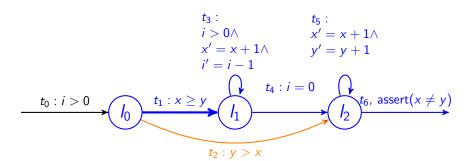

No precondition, since y > x contradicts x > yPath is maybe safe, but not for x > y

CheckSafe on $\{\ell_1\}$ for x > y

 t_4 does not already imply x > y t_4 is not an initial transition Call CondSafe, get $i > 0 \land x \ge y$ as precondition

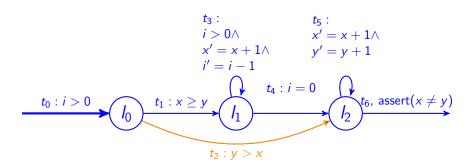

CheckSafe on $\{\ell_0\}$ for i > 0

 t_1 does not already imply i > 0 t_1 is not an initial transition Call CondSafe, get i > 0 as precondition

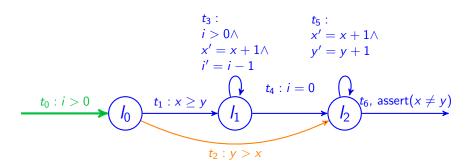

Fabian Böller with David Korzeniewski (i2)

10 / 11

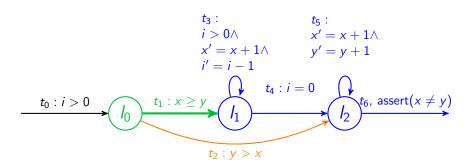

CheckSafe on initial SCC for i > 0

 t_0 does already imply i > 0

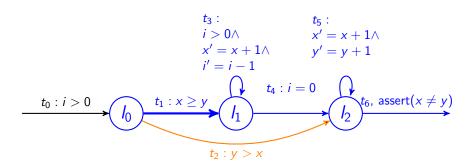

CheckSafe on initial SCC for i > 0

Path is safe for i > 0

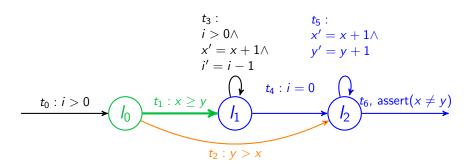

CheckSafe on $\{\ell_0\}$ for i > 0

Path is safe for i > 0

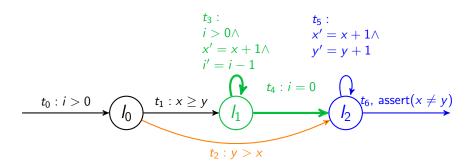

CheckSafe on $\{\ell_0\}$ for $x \geq y$

 t_1 does already imply $x \ge y$

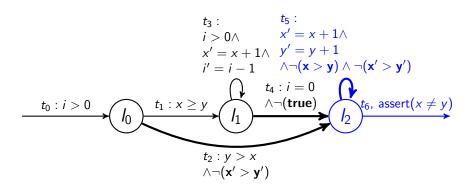

CheckSafe on $\{\ell_0\}$ for $x \geq y$

Path is safe for $x \ge y$

CheckSafe on $\{\ell_1\}$ for x > y

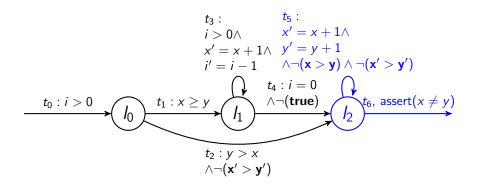

Path is safe for x > y

Narrow on $\{\ell_2\}$

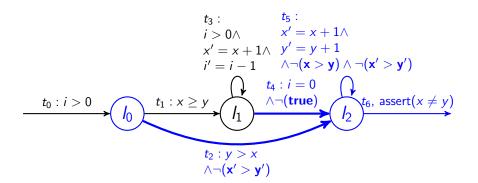

Add
$$\neg(x' > y')$$
 to t_2
Add $\neg(x > y) \land \neg(x' > y')$ to t_5

Remove t_4

CheckSafe on $\{\ell_2\}$ for $x \neq y$

Call CondSafe, get y > x instead of x > y as precondition

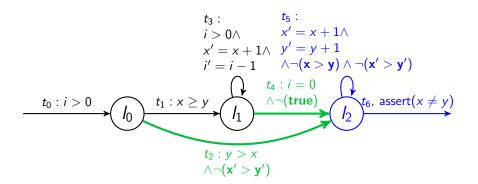

CheckSafe on $\{\ell_0\}$ for y > x

 t_2 does already imply y > x

 t_4 does already imply y > x

CheckSafe on $\{\ell_0\}$ for y > x

Paths are safe for y > x

CheckSafe on $\{\ell_0\}$ for y > x

Program is safe for $x \neq y$

Conclusion

We saw:

- The exploration of multiple entry SCCs by CheckSafe
- The effect of narrowing if a path to the SCC is proved safe and another could not be proved safe
- The behavior of CheckSafe if a precondition with multiple conjunctions is found

We didn't saw:

 SCCs with multiple transitions (effects consecution conditions in Max-SMT and entry locations in Narrowing)
